\*1: "S" may be printed to the right of the marking (except SI-8090S, SI-8120S, SI-8150S).

\*2: Pin 5 is a soft start pin. Soft start at power on can be performed with a capacitor connected to this pin.

The output can also be turned ON/OFF with this pin.

The output is stopped by setting the voltage of this pin to V<sub>SSL</sub> or lower.

Soft-start pin voltage can be changed with an open-collector drive circuit of a transistor.

When using both the soft-start and ON/OFF functions together, the discharge current from C<sub>3</sub> flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C<sub>3</sub> capacitance is large.

The ON/OFF pin is pulled up to the power supply in the IC, so applying the external voltage is prohibited.

If this pin is not used, leave it open.

T<sub>a</sub>-P<sub>d</sub> Characteristics

$$P_D = V_o \cdot I_o \left( \frac{100}{\eta \chi} - 1 \right) - V_F \cdot I_o \left( 1 - \frac{V_o}{V_{IN}} \right)$$

The efficiency depends on the input voltage and the output current. Therefore, obtain the value from the efficiency graph and substitute the percentage in the formula above.

- V<sub>o</sub> : Output voltage
- V<sub>IN</sub> : Input voltage
- I<sub>o</sub> : Output current
- ηχ : Efficiency (%)
- V<sub>F</sub> : Diode D<sub>1</sub> forward voltage  
0.5V(RK46)

Thermal design for D<sub>1</sub> must be considered separately.
